Specifications

DIMENSIONS: 24.1cm(H) x 42.4cm(W) x 12.1cm(D)
9-1/2" x 16-3/4" x 4-3/4"

WEIGHT: Approx. 4.5 kg (with batteries)
9.9 lbs.

TUNER SECTION

Frequency Ranges : FM 88~108MHz
SW 6~18MHz
MW 540~1600kHz
LW 150~350kHz

RECORDER SECTION

Tape Speed : 4.8 cm/s (1-7/8 ips)
Track System : 4-track 2-channel stereo
Recording System : AC Bias
Erasing System : DC Erasing
S/N Ratio : 40dB at 1kHz
Fast Forward Time : Within 100 sec. (C-60 cassette)
Rewinding Time : Within 100 sec. (C-60 cassette)
Wow & Flutter : 0.09% (WRMS)

AMPLIFIER SECTION

Speakers : 12 cm (5") x 2, 3.2Ω

Power Output

: Max. 5.4W (2.7W+2.7W)(DC)
4W (2W+2W)(DC) at 10% THD

Input Jacks

: MIC x 2 (0.8mV, low imp.)

Output Jacks

: Ext. Speaker x 2 (3.2~8Ω)
Headphones x 1 (8Ω)

Input/Output Jack

: DIN

POWER CONSUMPTION

: 12W (RC-646L)
9.5W (RC-646LB)

SEMICONDUCTORS

ICs : 7 + 2 (Microphone)
Transistors : 21 + 2 (Motor governor)
Diodes : 33 (5 LEDs)

POWER SOURCE

DC : 9V, 6 "R20", "U2" cells or equivalent
AC : 110/220/240V, 50/60Hz

Technical Information

This recorder is adopted with the full auto stop mechanism, MULTI MUSIC SCANNER and timer standby facility.

Full Auto Stop Mechanism

When the tape is finished in any mode: playback, record, fast forward and rewind, the tape transporting mechanism stops and the corresponding control buttons return to their normal positions and the power is shut off.

MULTI MUSIC SCANNER (Automatic program selection facility)

Newly developed MULTI MUSIC SCANNER (MMS) can select the next or preceding program, skipping the present program.

The MMS mechanism operates by detecting non-recorded sections on the tape. (Non-recorded sections of 3~4 seconds)

Timer Standby Facility (Timer recording and playback)

The facility can perform recording or playing back at any desired time by using an audio timer.

The PAUSE button is automatically released and the recording or playing back starts when the power is applied from the timer.

Circuitry of MMS and Auto Stop Mechanism

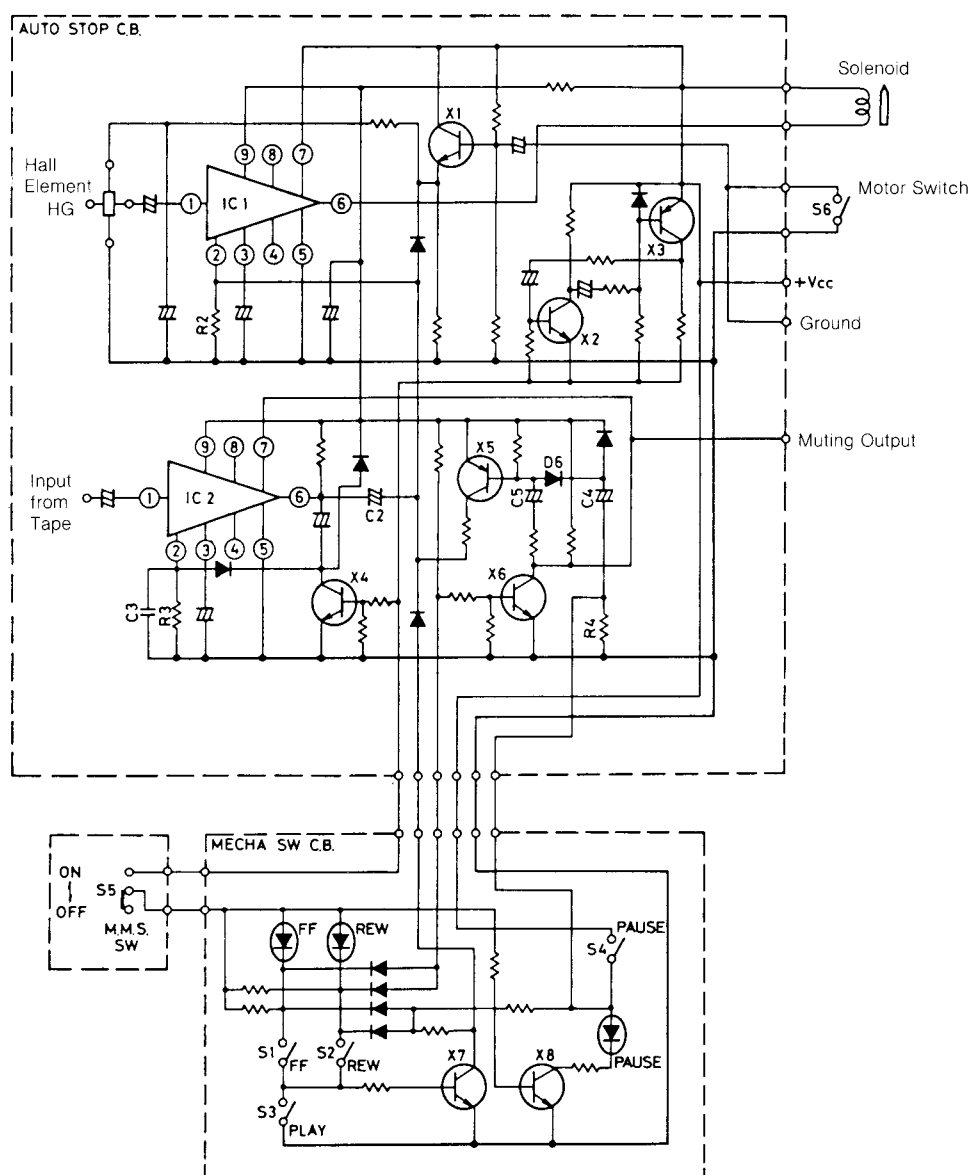

Fig. 1

A. Auto Stop Mechanism

The tape stop is detected by the Hall element (HG) which is located in the magnetic field of ring magnet; the magnet is connected to the shaft of the tape counter and it is rotating while the tape is running. The Hall element generates the sine wave signal by rotating magnet while the tape is running.

When the input signal of the IC1 has stopped, the logical level of the No. 6 terminal becomes "L" (low) level.

If the No. 6 level become "L", voltage difference occurs across the solenoid, so that the current flows through the solenoid and the plunger functions to stop the mechanism.

B. MMS Operation

In the MMS mode, switches S1 (or S2), S3 and S5 have been ON position and the transistor X4 has been OFF state.

The logical level of the terminal No. 6 of IC2 changes in accordance with the input signal level of terminal No. 1: If the input level is more than $-50\text{dBs} \pm 5\text{dB}$, the terminal No. 6 becomes "H" (High) level. If it is less than $-50\text{dBs} \pm 5\text{dB}$, becomes "L" level.

While the signal from the tape being supplied to the No. 1 terminal of IC2 the terminals No. 2 and No. 6 become "H" level.

When the input signal has stopped, i.e. a non-recorded section between programs on the tape has positioned to the play/record head, No. 6 terminal changes into "L" level.

If No. 6 terminal has been "L" level, the current flows across the solenoid and the plunger functions to stop the MMS mechanism.

C. Timer Standby Facility

In the timer standby mode, switches S3, S4 and S6 are in the ON position and the power supply is cut off.

When the power supply turns on at the time set by the timer, the No. 2 and No. 6 terminals of IC1 become "L" level, as the capacitor C2 has not been charged, so that the solenoid functions to release the PAUSE button. And the recording or playing back starts.

D. Prevention Circuit Against Double Action

1. When the PAUSE button is released

At the moment when the PAUSE switch S4 is turned off by releasing the PAUSE button, the capacitor C4 is charged by the current flows through X5 and D6, so that the transistor X5 turns ON state.

The collector current of X5 raises the level of No. 2 terminal of IC1 into "H" level, so that the No. 6 terminal changes into "H" level.

When the terminal No. 6 becomes "H" level, the current flows through the solenoid is cut off and the plunger is prevented from functioning once again.

2. When the CUE or REVIEW button is released

At the moment when the switch S1 (or S2) turns off, while the switch S3 is ON, transistor X6 becomes ON state and the capacitor C5 is charged by the current flows through X5, so that the X5 changes into ON state.

The proceeding process is the same as the preceding item "1. When the PAUSE button is released".

E. Indicator Flicker Circuit

The transistors X2 and X3 construct the multivibrator circuit. The multivibrator is a relaxation oscillator and drives the MMS indicators to flicker.

The transistor X8 acts as a switch to flicker the PAUSE indicator.

F. Ripple Filter

The transistor X1 constructs a ripple filter which is designed to reduce the ripple current flowing through the Hall element.

G. Anti-Pause Killer Circuit

In the fast forward or rewind mode, to function the auto stop mechanism though the PAUSE button has been depressed, the anti-pause killer circuit stops the current supplying to the No. 2 terminal of IC1 by switching the transistor X7 off.

- Note:**
1. Asterisked parts (*) show "NEW PARTS". Other parts are all "CURRENT PARTS"; therefore, check your inventory and order situation before placing new order to avoid making extra stock.
 2. The circuit board assemblies and whole assembly of cassette mechanism in this model will not be available as spare parts.
 3. The parts marked  are the important parts for safety assurance. Use the specified part, when replacing the safety assurance part, never use an equivalent one.

Disassembly & Replacement

A. Rear Cabinet

1. Remove the battery cover.
2. Remove 7 screws (1)~(7): SDSB3020R.
3. Disconnect 3 connectors from the rod antenna (white) and power supply section (red & black).

Fig. 4

C. Amplifier Circuit Board

1. Take off the volume, balance and tone control knobs.
2. Disconnect 3 connectors (B), (C) & (D).
3. Remove 6 screws (10)~(13): SPSP3006VS and (14) & (15): SBSB3010C.

Fig. 6

B. Tuner Section

1. Take off the tuning and fine tuning knobs.
2. Disconnect the 5-pin connector (A) from the amplifier section and the connector (F) to the speaker terminal.
3. Remove 2 screws (8) & (9): SBSB3025C.

Fig. 5

D. Amplifier Section (with Cassette Mechanism)

1. Take off the volume, balance and tone control knobs.
2. Disconnect 4 connectors (A), (B), (C) & (D).
3. Remove 7 screws (14)~(20): SBSB3010C.
4. Open the cassette case by depressing the STOP/EJECT button to disengage the internal mechanism.

Fig. 7

E. Cassette Mechanism

1. Remove the amplifier section in accordance with the item D.
2. Remove 4 screws (10) ~ (13): SPSP3006VS.
3. Desolder wires from the motor, heads and leaf switch on the cassette mechanism.
4. Disconnect the connector (E).

Fig. 8

G. Power Supply Section

Remove 2 screws (21) & (22): SBSB3014C.

Fig. 10

F. Jack Board

1. Remove the amplifier circuit board as following the item C.
2. Remove 2 screws (23) & (24): SBSB3012Z.

Fig. 9

Tuner Alignment

Output Measuring: Speaker terminal (Impedance = 3.2Ω), output level 50mW (0.4V/ 3.2Ω)

AM IF & RF Alignment

Input (SSG) Modulation 400Hz, Modulated to 30%

Step	Frequency Band	Input Signal		Place to be aligned	Set the V. Capacitor to
		Frequency	Given to		
1	MW (IF)	455kHz	Loop Antenna	T2, 3	Minimum
2		Repeat the Step 1, and adjust for no further improvement.			
3	LW	145kHz	Loop Antenna	L7	Maximum
4		360kHz		TC6	Minimum
5		Repeat the Steps 3 & 4.			
6		160kHz	Loop Antenna	L4	160kHz Signal
7		350kHz		TC1	350kHz Signal
8		Repeat the Steps 6 & 7, and adjust for no further improvement.			
9	MW	520kHz	Loop Antenna	L8	Maximum
10		1650kHz		TC7	Minimum
11		Repeat the Steps 9 & 10.			
12		600kHz	Loop Antenna	L5	600kHz Signal
13		1400kHz		TC2	1400kHz Signal
14		Repeat the Steps 12 & 13, and adjust for no further improvement.			
15	SW	5.8MHz	Rod Antenna through Dummy Antenna	L9	Maximum
16		18.6MHz		TC8	Minimum
17		Repeat the Steps 15 & 16.			
18		6.0MHz	Rod Antenna through Dummy Antenna	L6	6.0MHz Signal
19		18.0MHz		TC5	18.0MHz Signal
20		Repeat the Steps 18 & 19, and adjust for no further improvement.			

FM IF & Discriminator Alignment

Input (Sweep Generator) : TP3 (hot)

Output (Oscilloscope) : IF TP4 (hot) & TP7
Discriminator TP6 (hot) & TP7

Step	Mode	Place to be aligned	Wave form
1	IF	T1, 4	Peak
2	Discriminator	T5	S-curve

FM RF Alignment

Input (SSG): Use 75 Ω terminal, modulation 400Hz modulated to 22.5kHz deviation.
Connect Hot side to TP1 and Cold side to TP2.

Step	Frequency Band	Input Signal		Place to be aligned	Set the V. Capacitor to
		Frequency	Given to		
1	FM	87.5MHz	TP1 & TP2	L3	Maximum
2		109MHz		TC4	Minimum
3		Repeat the Steps 1 & 2.			
4		90MHz	TP1 & TP2	L1	90MHz Signal
5		106MHz		TC3	106MHz Signal
6		Repeat the Steps 4 & 5, and adjust for no further improvement.			

FM MPX Alignment

A. Regular Method

1. Connect a frequency counter to the test point TP5.
2. Supply the monaural signal (98MHz, 60dB) across the test points TP1 and TP2.
3. Adjust the variable resistor VR1 so that the frequency becomes 19kHz \pm 100Hz.

B. Simplified Method

1. Tune to a FM stereo broadcast.
2. Set the variable resistor VR1 to a center position of the range where the stereo indicator keeps lighting.

Dummy Antenna

$$R1 + R2 = 80\Omega$$

$$C = 10\text{pF}$$

R1 : Output impedance of S.S.G.

Fig. 11

Parts Arrangement for Alignment

Fig. 12

Adjusting Recording Bias

Bias Frequency

1. Connect a frequency counter across TP101.
2. Set the BEAT CUT switch to left position.
3. Adjust the oscillator coil L301 so that the counter indicates 68kHz.

Bias Current

1. Connect a V.T.V.M. across TP101 and TP201.
2. Adjust the variable resistor VR101 (L) and VR201 (R) so that the voltage becomes 4.5mV ($450\mu\text{A}/10\Omega$).

Fig. 13

Adjusting Head Azimuth

Regular Method

1. Connect a dual channel oscilloscope to the speaker terminals.
2. Set the MODE switch to the STEREO position.
3. Playback the test cassette for azimuth adjustment.
4. Adjust the head azimuth so that the output signals of left and right channels will become maximum and in phase.

Note: If a single channel oscilloscope will be used, apply the left channel signal to the X-axis and the right to the Y-axis and draw the Lissajous figure.

Simplified Method

1. Connect a V.T.V.M. across the speaker terminal.
 2. Set the MODE switch to MONO.
 3. Playback the test cassette for azimuth adjustment.
 4. Adjust the head angle for maximum output.
- Note:** The output voltage shows three peaks while adjusting head angle as illustrated on the right, adjust for maximum peak.
5. Check that the output difference between MONO and STEREO is within 3dB.

Fig. 14

Adjustment of Cassette Mechanism

Timing of Auto Stop Motion

1. The auto stop mechanism should function at the moment when the tip of stop detect contact has been moved within 0.5 to 1.8mm in the playback mode.
2. If the timing is more than 1.8mm, bend the part (A) of stop detect lever to the B direction. If it is less than 0.5mm, bend the part (A) to the C direction

Fig. 15

Detection pressure of Auto Stop Mechanism

1. Setting the mechanism vertically in the playback mode, the auto stop mechanism should function at the pressure of 45 to 65g when the tip of stop detect contact has been pulled upwards by a tension gauge. (Refer to Fig. 16)
2. If the pressure is less than 45g, bend the adjusting arm to the A direction. If it is more than 65g, bend to the B direction.

Fig. 16

Fig. 17

Thrust of Flywheel

The clearance between the top of flywheel shaft and the flywheel bracket should be within 0.1 to 0.4mm. If the clearance is beyond the limits, adjust the screw for normal value.

Note: After adjustment, fix the screw with lock adhesive.

Fig. 18

Pause Mechanism

1. In the playback mode, check to see that the pinch roller separates from the capstan shaft and stops turning and then the reel disk stops turning and the tape stops when the PAUSE button has been pressed. Check to see that the tape restarts and is normally transported when the PAUSE button is released.
2. If the timing of pause mechanism is out of order: the takeup reel disk stops first and then the pinch roller stops, so that the tape is projected from the cassette half.
Adjust the timing by bending the part (C) of pinch arm lever to the A direction.
3. The space between the pinch roller and the capstan shaft should be more than 0.5mm. If it is less than 0.5mm bend the part (C) to the A direction, and if it is excess bend the part (C) to B direction.

Fig. 19

Cue & Review Mechanism

1. Timing of Cue Action

- In the playback mode, if the CUE button is gradually pressed, the pinch roller stops turning first and then the takeup reel disk stops. If the CUE button is released, the takeup reel disk turns first and then the pinch roller rotates.
- If the timing is out of order, adjust it as follows.
 - If the tape is projected from the cassette half at the beginning of cue action, adjust it by bending the part (C) of pinch arm lever to the A direction as shown in Fig. 19.
 - If the tape is fast forwarded at the beginning of cue action, bend the part (C) to the B direction as shown in Fig. 19.

2. Timing of Review Action

- In the playback mode, if the REVIEW button is gradually pressed, the pinch roller stops turning first and then the takeup reel disk stops. If the REVIEW button is released, the takeup reel disk turns first and then the pinch roller rotates.
- If the timing is out of order, adjust it as follows.
 - If the tape is projected from the cassette half at the beginning of review action, bend the part (C) to the A direction as shown in Fig. 19.
 - If the tape is fast forwarded at the beginning of review action, bend the part (C) to the B direction as shown in Fig. 19.

Notes: 1. After adjustment, if the pinch arm lever has been bended, check the pause timing and check that the gap between the pinch roller arm and pinch arm lever is more than 0.2mm when the REVIEW button is pressed in the recording mode.

2. After adjustment check that the gap between the RQ boss and the pinch roller arm plate is within 0.7 to 1mm. If it is beyond the limits, adjust it by bending the part (D) of pinch roller arm plate as shown in Fig. 19.

Location of Heads

The play/record and erase heads should be positioned as shown below in the playback mode.

Fig. 20

Pressure of Pinch Roller

- Setting the mechanism vertically in the playback mode, the pinch roller should stop turning at the pressure of 350~500g when the pinch roller arm has been pulled upwards by tension gauge as shown in Fig. 21.
- If the pressure is out of limit, change the pinch roller spring.

Note: If the pressure is excessively high, it may cause the noise from the pinch roller bearing and defective in wow and flutter. If the pressure is defectively low, it may cause defective in Auto stop motion and in wow and flutter.

Fig. 21

Playback Torque

- The playback torque should be within 40 to 70g-cm.
- If the torque is less than 40g-cm, set the clutch spring to the 3 position. If it exceeds 70g-cm, set the clutch spring to the 1 position.

Note: Before adjusting the torque wipe off the surface of rubber parts and rotating parts, if the torque is not sufficient.

Fig. 22

How to Fit Dial Cord

Adjustment of F.F. & Rewind Torque

1. Fast Forward Torque

In the fast forward mode, check that the F.F. torque is within 100 to 160g-cm by applying the torque gauge to the take-up reel disk.

a. If the torque is less than 100g-cm, adjust as follows.

- 1) If the rotation of F.F. idler which is contacted with the flywheel stops or fluctuates when the take-up reel disk is stopped turning by the fingers, bend the part A of F.F. button lever to the C-direction.
- 2) If the F.F. idler contacted with the flywheel is turning constantly when the take-up reel disk is stopped turning, turn the three-flap clutch spring plate counterclockwise (1→2→3→4) to obtain the proper torque.

b. If the torque is over 160g-cm, turn the clutch spring plate clockwise (4→3→2→1) to obtain the proper torque.

2. Rewind Torque

In the rewind mode, check that the rewind torque is within 100 to 160g-cm by applying the torque gauge to the supply reel disk.

If the torque is out of standard, adjust it as same method as items a. & b. of "Fast Forward Torque".

1. Dial Cord

Material : Teton
Diameter of cord : 0.6mm (24 mil)
Whole length of cord : 775mm (30-1/2")

2. Turn the dial drum fully clockwise.

3. Fit the cord in numerical order as shown below.

Fig. 24

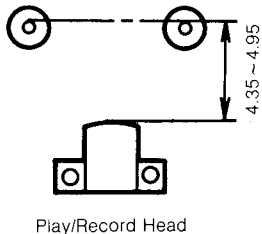

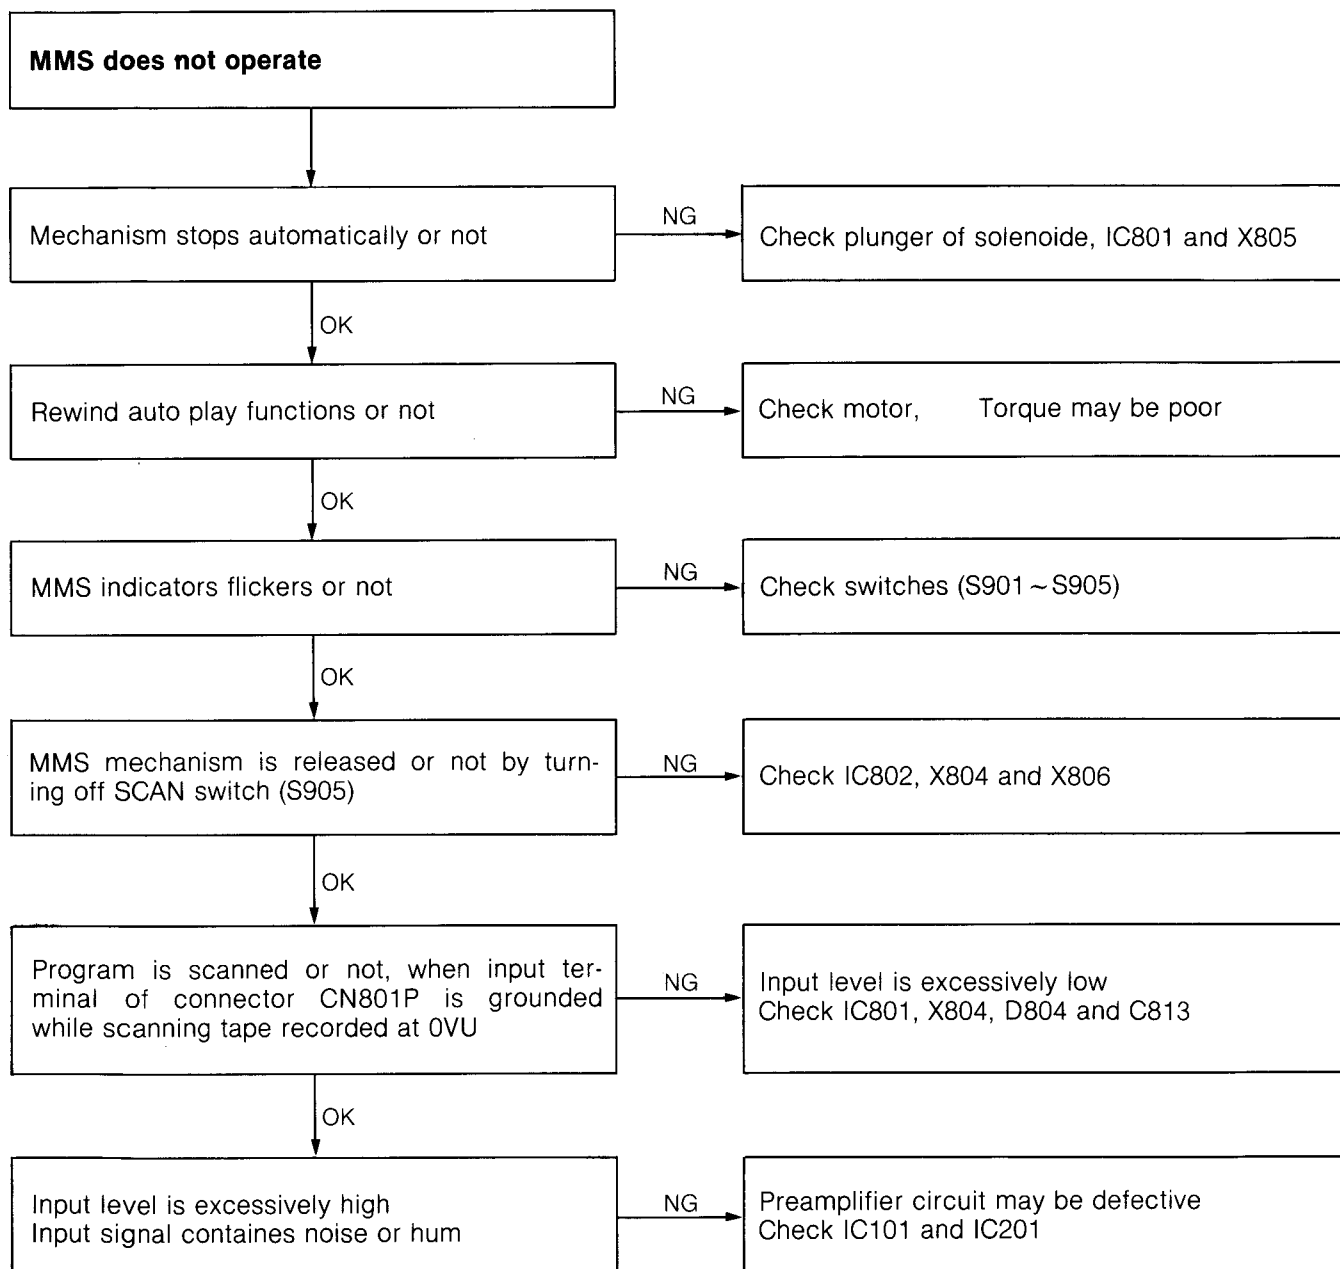

Fig. 23

Specifications of Cassette Mechanism

Check the following items when replacing the component parts of cassette mechanism.

Item	Specifications	Remarks
1. Power Supply (Motor)	Rated Voltage DC 9V Operating Voltage DC 6.0 ~ 11V	Item 2 should be complied at the upper and lower limit of operating voltage.
2. Tape Speed	4.8cm/s (1-7/8 ips) 3000Hz +3%, -2% Deviation 2%	2940Hz ~ 3090Hz
3. Wow & Flutter	Less than 0.25% (RMS)	
4. Take-up Torque	Play 40 ~ 70g.cm Fast Forward 100 ~ 160g.cm Rewind 100 ~ 160g.cm	
5. Winding Time (at rated voltage)	Fast Forward Within 100 sec. Rewinding Within 100 sec.	C-60 cassette
6. Supply Current (at rated voltage)	Play Max. 150mA F.F. Max. 360mA Rewind Max. 360mA	
7. Button Pressure	Play Max. 2.0 kg F.F. Max. 2.0 kg Rewind Max. 2.0 kg Stop Max. 2.0 kg Record Max. 2.5 kg Cue Max. 2.0 kg Review Max. 2.0 kg Eject Max. 1.0 kg Pause Max. 1.0 kg	
8. Pinch Roller Pressure	350 ~ 500g	
9. Head location of CUE and REVIEW Modes	 <p>Play/Record Head</p>	The PLAY and CUE (or REVIEW) buttons have been depressed.
10. Auto Stop Mechanism	In the every mode: playback, record, fast forward and rewind, the mechanism should stop automatically at the time when 4.3V is applied across the solenoid after the tape has been taken up while the decreased voltage of 5.0V has been supplied to the motor.	
11. MMS Operation	In the MMS mode: PAUSE, PLAY and CUE (or REVIEW) buttons have been depressed, if 4.9V is applied for a moment across the solenoid after the tape has been taken up while the motor has been supplied 5.0V, the PAUSE button should be released first and then the CUE (or REVIEW) button released.	
12. Timer Standby Facility	If 4.3V is supplied to the solenoid, the PAUSE button should be released when the PAUSE has been depressed in the playback or recording mode while the motor is driven by 5.0V.	

Troubleshooting on MMS

MMS indicators do not flicker though MMS operates

- Multivibrator circuit may be defective, check X802 and X803.
- Electrolytic capacitor may be lack of capacitance, check C807 and C808.
- If PAUSE indicator do not flicker or light, X902 and D908 may be defective.

Immediately auto stop mechanism functions

- Hall element (HG801) is far away from ring magnet. Check distance, normal range is $1\text{mm} \pm 0.5\text{mm}$.
- Output of Hall element may be poor.
- IC801 may be defective.

- Resistor R801 may be lack of resistance. (Normal value: $150\text{k}\Omega$)
- Bias circuit of X801 is not optimum. Base voltage is nearly equal to a half of V_{cc} .
- X805 may be defective. Common emitter dc current gain h_{FE} may be lower than normal.
- Capacitors C814 and C816 may be defect in capacitance.

Auto stop mechanism does not operate in FF and rewind modes when PAUSE button being pressed

- X901 may be defective.
